

Product Overview

Wireline Spears are heavy-duty fishing tools designed for retrieving wireline that has become badly bundled or compacted inside the wellbore, where conventional two-prong wireline grabs cannot achieve a secure engagement.

The spear is engineered to penetrate and securely grip the tangled wire mass, enabling safe and efficient recovery during wireline fishing operations. Manufactured from high-strength alloy steel and precision machined for dependable performance, Wireline Spears provide excellent durability and reliable engagement in demanding downhole environments.

Key Features

- Designed for difficult wireline fishing operations
- Effective where two-prong wireline grabs cannot engage
- High-strength alloy steel construction
- Precision-machined for reliable internal engagement
- Available in multiple sizes to suit different fishing diameters
