

Product Overview

The **Fluted Centralizer** is designed for use in deviated wells to ensure that the wireline tool string remains in a centralized position within the tubing or casing. By maintaining proper centralization, the tool helps improve tool alignment, enhances operational efficiency, and reduces contact between the tool string and the wellbore wall during wireline operations.

Key Features

- Maintains centralization of the wireline tool string
- Designed specifically for deviated well applications
- Fluted body design for smooth movement through the wellbore
